The Fillmore Group InfoSphere Change Data Capture Quickstart

Highlights

- InfoSphere Change Data Capture (CDC) enables high-performance, low-latency, real-time data integration.
- CDC Quickstart delivers expert consulting resources to install and test CDC for your organization.
- This offering includes IBM authorized training to enable your team to confidently support CDC.

About Change Data Capture

IBM InfoSphere Change Data Capture software enables organizations to reduce operational costs and risk while improving the accessibility of critical business data. CDC offers high performance, low-latency, real-time data integration. CDC can be used to feed InfoSphere Warehouse and Master Data Management, dynamically route data - based on content - to message queues across the enterprise, populate dashboards, and consolidate data across disparate systems.

If your organization plans to implement InfoSphere Change Data Capture to enable enterprise data movement, this offering provides consulting services to ensure a successful implementation project effort.

The CDC Quickstart offering will provide your team with an expert resource to:

- Assist with replication design and implementation planning.
- Install CDC in test, development and production environments.
- Implement monitoring, test replication and perform validation demonstration.
- Deliver IBM course DX550, "Change Data Capture Essentials" to enable your staff to tune, modify and support CDC on an ongoing basis.
