

# THE FILLMORE GROUP

## Relational Database Solutions

### Customer Success

**Customer:** The National Gallery of Art

**Industry:** Museum/Not for Profit

The National Gallery of Art maintains records of their collection in a DB2 Server for VSE&VM database using a custom application developed using a decades old fourth generation language tool to meet their stringent requirements. The database shared space with the Gallery's financial system for many years.

When the Gallery's management opted to implement a new Windows-based financial system they began evaluating existing museum collection software applications able to run on the same system. Ultimately a selection was made, and efforts are underway to migrate collection records to the new MS SQL Server system in late 2007.

The Fillmore Group has provided remote and onsite support and service to the Gallery to ensure the DB2 Server for VSE&VM system continues to perform while customization to the new application is being completed, and assistance to the new application development team to migrate user data from DB2 to SQL Server.
